is a product Made in Italy

information:

The electronic ignition has been specially designed to replace the ignition system distributor Ducati wide case single-cylinder engine wiring 6V

- The application of the electronic control unit is extremely easy and requires no invasive intervention on the original parts of the motorcycle. All kit components are made specifically to be installed on single-cylinder Ducati and are provided with the necessary fastening systems and complete electrical wiring.
- The application of the electronic control unit to retain the outer coil AT Original and eliminate the centrifugal advance, the tacks and the capacitor and offers the advantage of keeping constant the phase of the ignition advance greatly reducing maintenance interventions.
- The electronic control unit automatically manages the advance angle in a progressive manner, namely the advance varies with shifts of engine speed. This facilitates starting and allows to have a more fluid power dispensing
